

CS 470 Module Five Assignment One Guidelines and Rubric

Overview

In this module, you will create a database to replace the Mongo database used in Modules One and Two. While DynamoDB is a NoSQL database like Mongo, it does have some differences. You can still store JSON data. But DynamoDB is a different type of NoSQL and has some differences in its approach. Not all of the differences are covered in this module. You will create a DynamoDB database. Then you will create the table that provides structure to the database. DynamoDB is geared toward the “single-table design” model. The concept is that you store the complete entity in a single table instead of decomposing your data into different entities that are normalized.

Directions

There are two key data elements in the Angular application. You will replicate those models used in Mongo in DynamoDB and not redesign the models. Replicating the models will allow you to repoint the existing application to use DynamoDB without any code changes in the Angular application. It will help to create a database using the single-table design concept. You should partition the table using a partition key. A database that's correctly created with the appropriate structure can perform the CRUD functions. Use the Module Five Assignment One Guide linked in the Supporting Materials section below to complete the tasks and produce your deliverables.

Specifically, you must address the following rubric criteria:

- Create and name a DynamoDB table with the appropriate partition key.
- Add five items with the appropriate attributions and adjust the JSON.
- Perform a table scan with results that show questions and answers on each of the tables. Add 4–5 records to the database for each table.

What to Submit

Submit the following screenshots or files to Brightspace:

- A screenshot of the overview tab for the Question table
- A screenshot of the overview tab for the Answer table

Supporting Materials

The following resources may help support your work on the assignment:

Resource: [Module Five Assignment One Guide](#)

This guide supplies specific instructions for the assignment.

Module Five Assignment One Rubric

Criteria	Meets Expectations	Partially Meets Expectations	Does Not Meet Expectations	Value
Create the Table	Creates and names the listed table, with the appropriate partition key (100%)	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include misspellings that may cause errors or the wrong partition key (75%)	Does not attempt criterion (0%)	35
Populate Tables	Correctly adds five items with the appropriate attributes, and adjusts the JSON (100%)	Shows progress toward meeting expectations, but with errors or omissions; areas for improvement may include misconfiguring JSON records or changing questions and ID fields (75%)	Does not attempt criterion (0%)	50
Table Scan	Performs a table scan; the results show questions and answers on each of the tables, 4-5 records are added to the database for each table (100%)	N/A	Does not attempt criterion (0%)	15
Total:				100%
